

It is designed with special pins, which can eliminate the linear displacement caused by the different expansion coefficient of ceramic capacitor and PCB board, solve the solder joint fatigue problem and eliminate the porcelain cracking caused by PCB board bending, and improve the reliability of the product.

## — TECHNICAL INFORMATION

### 1 Application

The products are mainly used in communications, radar, artillery fuze, shipboard and aviation, aerospace, weapon systems and other electronic equipment and civil high-end equipment.

### 2 Aging Characteristic Of Capacitor

CLASS 2 ceramic capacitors due to medium characteristics, electric capacity will be reduced as the extension of placing time and slow, often called this the "CLASS 2 ceramic capacitor capacitance aging" phenomenon, capacitor aging is predictable, repeatable < can through the capacitor to aging, processing condition: heated to 150 °C/1 h, recovery after 24±2h, Restore capacitor capacity to initial state).

### 3 Test Conditions

#### 3.1 Electric capacity, loss tangent value test conditions:

(1) Test temperature : $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$ ; Test humidity :<70%;

(2) test frequency and voltage:

##### CLASS 1

$C_R \leq 1000\text{pF}$ , The test frequency:  $1\text{MHz} \pm 10\%$ ; test voltage:  $1\text{V} \pm 0.2\text{V}$

$C_R > 1000\text{pF}$ , The test frequency:  $1\text{kHz} \pm 10\%$ ; test voltage:  $1\text{V} \pm 0.2\text{V}$

##### CLASS 2

$C_R \leq 10\mu\text{F}$ , The test frequency:  $1\text{kHz} \pm 10\%$  ; test voltage:  $1\text{V} \pm 0.2\text{V}$

$10\mu\text{F} < CR < 470\mu\text{F}$  The test frequency:  $120\text{Hz} \pm 10\%$  ; test voltage:  $0.5\text{V} \pm 0.2\text{V}$

Note: after the dielectric voltage resistance or insulation resistance measurement, the capacitance measurement should be carried out after 24 hours of recovery.

(3) Test instrument :HP4284A(open ALC automatic level control function);

(4) Test fixture :HP16047A(applicable to lead products).

#### 3.2 Insulation resistance test conditions:

(1) Test temperature : $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$ ; Test humidity :<70%;

(2) Test frequency and voltage:

(3) Test instrument :HP4284A(open ALC automatic level control function);

(4) Test fixture :HP16047A(applicable to lead products).

#### 3.3 Test conditions for dielectric voltage resistance:

Rated voltage:  $U_R \leq 250\text{V}$ : apply 250% of rated DC voltage

Rated voltage:  $250\text{V} < U_R < 1000\text{V}$ : apply 150% of rated DC voltage

Rated voltage:  $U_R \geq 1000\text{V}$ : apply 120% of rated DC voltage

(1) The test voltage rate is  $50\text{V/s}$ , and the total voltage boost time is not more than 1min;

2) Test voltage application time:  $5\text{s} \pm 1\text{s}$ ;

(3) The test voltage application point: between the leading end of the capacitor;

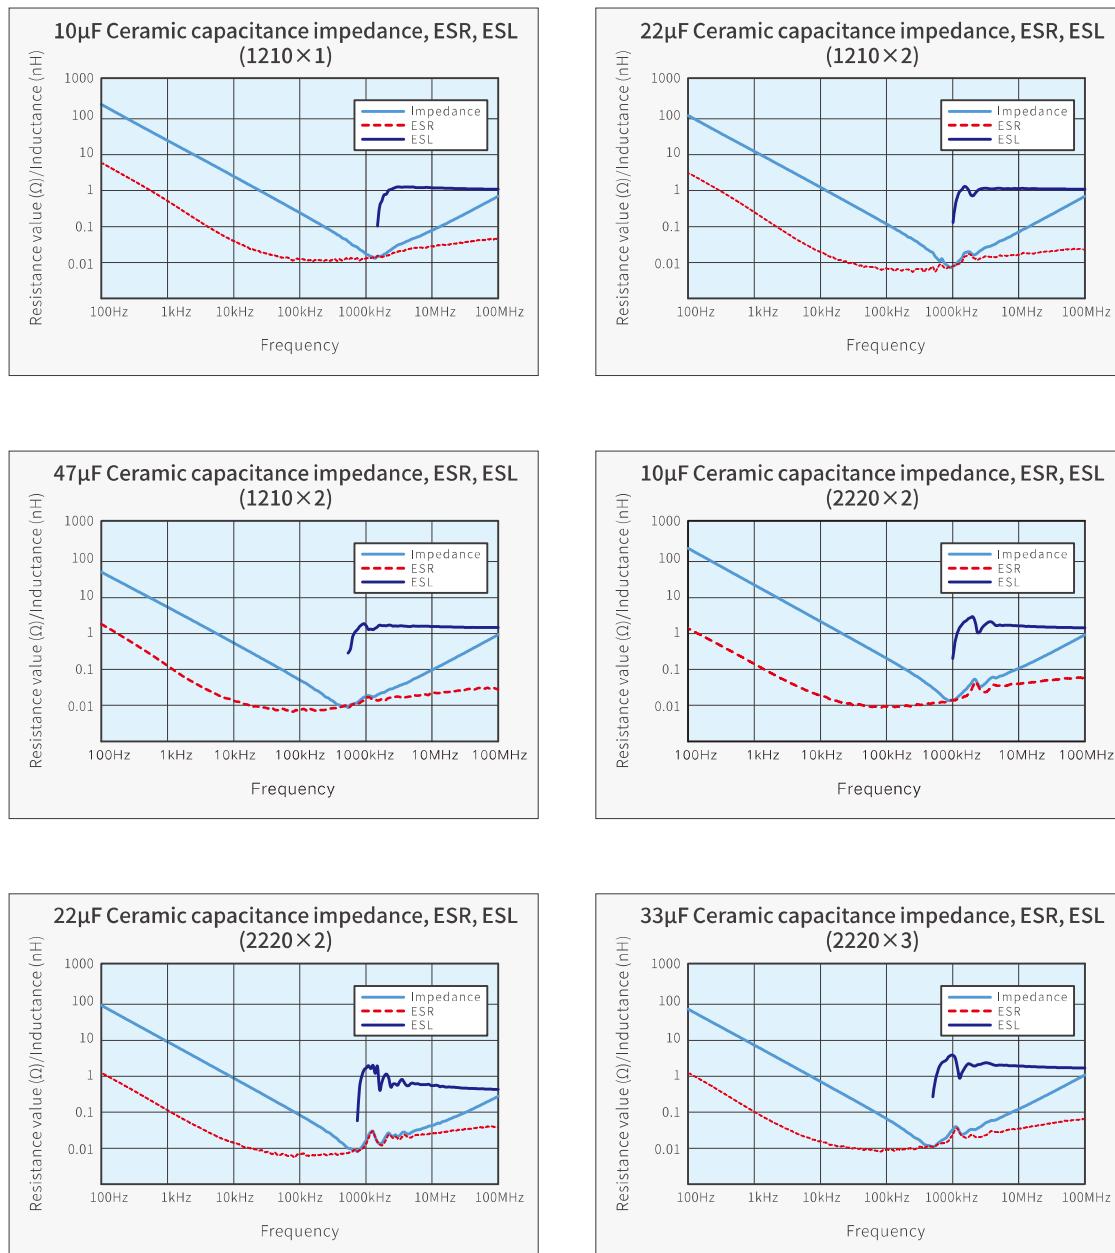

(4) Surge current limit value: should be limited to  $50\text{mA}$ ;

(5) After the test check: should check whether the capacitor breakdown, damage or arc.

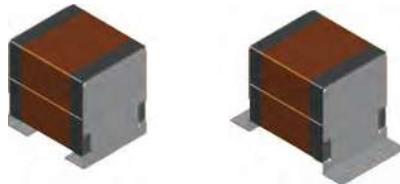

#### 4 Storage Conditions

Capacitor storage environment requirements: temperature of -10°C~40°C, if conditions should be controlled at -5~30°C; Relative humidity less than 70%RH; The surrounding environment is free from corrosive substances such as chlorine and sulfur, and the original packaging of the capacitor is kept to protect the product and can be opened before use. If the storage time exceeds one year, the weldability should be tested again. If the weldability index is qualified, the capacitor can continue to be used.

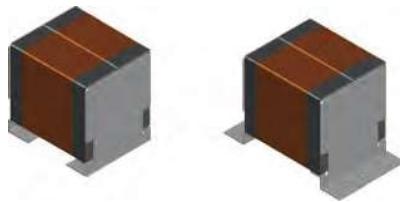

#### 5 Typical curves of impedance, ESR, ESL

## 二 INSTALLATION PROCESS

1 Recommended Installation Process

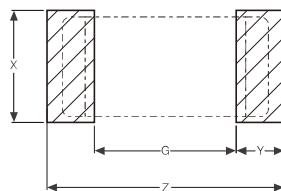

Multilayer ceramic chip capacitor assemblies Welding graphic

**Matters needing attention:**

- A) The welding surface shall be led downwards;
- B) In order to achieve better plate bending resistance and temperature impact resistance, solder should be reduced into the inner side of the metal pin during welding;
- C) During installation, the electric soldering iron should not directly contact the component base or the heat source of the electric blowtorch should not face the component base;
- D) Secondary disassembly and assembly welding is prohibited.

## 2 Recommended Pad Size

J type, L type pad design schematic diagram

4901 TYPE: Refluxing pads for horizontally stacked MULTILAYER CERAMIC CHIP CAPACITOR ASSEMBLIES Dimensions (J pin)					Unit:mm
Case size	Zmin	Gmax	Xmin	Y	
1206	6.0	1.0	3.0	2.5	
1210	6.0	1.0	4.0	2.5	
1812	7.0	1.6	5.0	2.7	
2220	9.0	2.0	6.8	3.5	

4901 TYPE: Refluxing pads for horizontally stacked MULTILAYER CERAMIC CHIP CAPACITOR ASSEMBLIES Dimensions (L pin)					Unit:mm
Case size	Zmin	Gmax	Xmin	Y	
1206	8.5	2.5	3.0	3.0	
1210	8.5	2.5	4.0	3.0	
1812	10	3.5	5.0	3.25

2220 × 1	12	5.0	4.5	3.5	
2220 × 2	12	5.0	8.0	3.5	
2220 × 3	12	5.0	10.0	3.5	

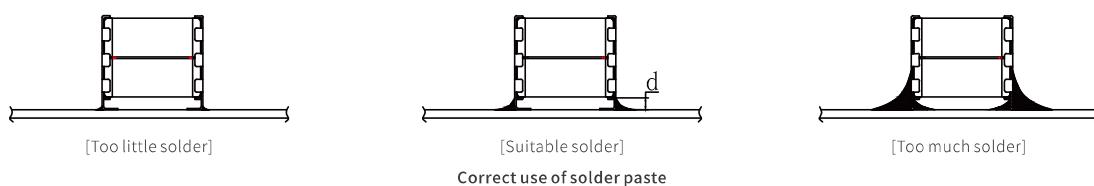

### 3 Solder paste and solder joint requirements

#### 3.1 Alloy composition of solder paste recommended

- (1) Sn63 / Pb37 (Sn60 / Pb40) solder paste;
- (2) Sn62Pb36Ag2 solder paste;
- (3) The use of tin-bismuth solder is prohibited to prevent the formation of tin-bismuth lead low melting point compound at the leading end of the solder joint, which affects the reliability of the capacitor
- (4) It is forbidden to use Sn63/Pb37(Sn60/Pb40) solder paste to weld the guide band containing Au and Ag and the lead surface coated with Au and Ag.

#### 3.2 Solder joint requirements

- (1) The solder content of the product is moderate, and the best printing paste thickness is (0.20-0.30) mm;
- (2) Solder joint shape should be as shown in Figure 3 below:

### 4 Optional welding mode

#### 4.1 Current-carrying welding (Reflow welding)

In order to reduce the temperature shock formed by welding, it is necessary to heat each part evenly to ensure the reliability of welding, and take the temperature rise (fall) rate  $\leq 4^{\circ}\text{C}/\text{s}$ .

The following is the analysis of the setting of each temperature zone:

**Preheating zone:** to ensure the balanced temperature rise of the printed board, the general setting is from room temperature to  $120^{\circ}\text{C} \sim 160^{\circ}\text{C}$  area < the actual temperature measured by thermocouple), the time is 100s~150s, the heating rate is  $1.0^{\circ}\text{C}/\text{s} \sim 2.0^{\circ}\text{C}/\text{s}$ .

**Heat preservation zone:** At this time, volatiles in solder paste are removed and flux is activated. At the end of the heat preservation zone, oxides on pads, solder balls and component pins are removed and the temperature of the whole PCB reaches equilibrium.Temperature : $160^{\circ}\text{C} \sim 180^{\circ}\text{C}$ , time: 90s~200s, heating rate : $0.5^{\circ}\text{C}/\text{s} \sim 1^{\circ}\text{C}/\text{s}$ .

**Reflux zone:** the zone where the temperature is higher than the melting point of the solder paste, the metal particles in the solder melt and form the solder spot surface under liquid surface tension.The temperature of reflow zone is generally  $20^{\circ}\text{C} \sim 25^{\circ}\text{C}$  higher than the melting point of solder paste.The reflow welding time is 6s~10s;The reflow welding temperature can be  $210^{\circ}\text{C} \sim 230^{\circ}\text{C}$ , and the heating rate is  $1.00^{\circ}\text{C}/\text{s} \sim 3.0^{\circ}\text{C}/\text{s}$ .

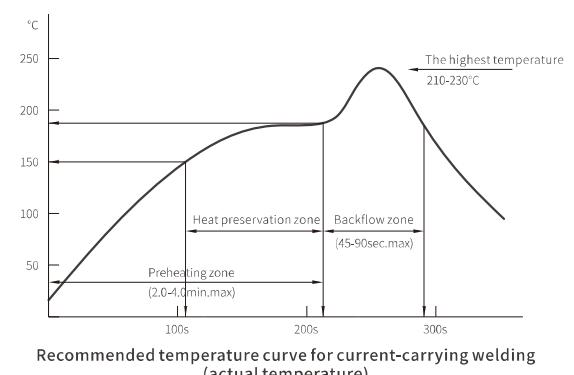

**Cooling zone:** from the melting point to room temperature area, cooling to about  $80^{\circ}\text{C}$ . Requirements: cooling rate  $\leq 4^{\circ}\text{C}/\text{s}$ ;If the cooling rate is too fast, the components may be damaged due to excessive thermal stress, welding joints crack and other adverse phenomena.

#### Recommended welding temperature curve:

Special note: the preheating time must be more than 2 minutes, and it is recommended that the temperature rise rate be between 1 and  $2^{\circ}\text{C}/\text{s}$ . It is recommended to use natural cooling in the cooling stage, and the cooling rate should not exceed  $4^{\circ}\text{C}/\text{s}$  at most. Otherwise, the capacitor may be damaged or damaged due to temperature shock (that is, it is easy to cause thermal shock failure).

#### 4.2 Manual Welding

When manual welding is used, the power is no more than 50W, the welding temperature is no more than  $300^{\circ}\text{C}$ , and the welding time is no more than 5 seconds. The product must ensure enough preheating temperature and time, it is recommended to preheat on the hot plate platform, which is conducive to the product welding and welding effect. The maximum preheating temperature of the platform is  $150^{\circ}\text{C} \sim 170^{\circ}\text{C}$ (adjusted according to the size of the plate and the conditions of the components on the board), and the holding time is more than 2min (the higher the preheating temperature can be reached by the capacitor welding pins, the more conducive to the welding of the product). Natural cooling at room temperature is adopted in the cooling stage.

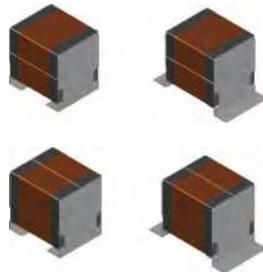

**FEATURES**

① Compared with the capacitance, aluminum electrolytic capacitor: higher insulation resistance and breakdown voltage, higher reliability;

No polarity, easy installation;

② External pin, heat conduction, heat dissipation effect is good, while reducing the impact of bad stress (environmental, mechanical stress), improve the reliability of use.

**APPLICATIONS**

Suitable for power bus filter, especially high-frequency switching power input/output filter.
